56 **Literature search, selection process and criteria**

57 This section is an overview of the literature search approach, and below we present the search
58 terms for each rate separately (maximum consumption, metabolism and growth). In addition
59 to search terms, we also applied filters by selecting only the following subjects: ‘marine
60 freshwater biology’, ‘fisheries’, ‘ecology’, ‘zoology’, ‘biology’, ‘physiology’. For growth
61 rates, we also included ‘limnology’ and for maximum consumption we included ‘limnology’
62 and ‘evolutionary biology’. The use of additional subjects for growth and consumption reflects
63 the lower data availability compared to metabolism. As we suspected that relatively few studies
64 would have considered both body size- and temperature treatments, our goal was to get an as
65 extensive as possible list of studies. Therefore, we also evaluated articles cited by articles found
66 in the search, from published review-type articles and reviews of applications of bioenergetics
67 models such as the Wisconsin model ¹, and if the study was found in the literature search for
68 another rate. The source of the article (WoS search or cited in literature) is indicated in the data
69 sets (Table S1).

70 Articles were filtered out at three levels of the search: title, abstract and full article. The
71 online repository of this project (<https://github.com/maxlindmark/scaling>) contains .txt files of
72 the complete list of articles found in the literature search. We removed studies from the lists if
73 the titles made it clear the articles did not fulfil all of the following conditions: (1) experimental
74 study, (2) fish as study organism in post-larval life stages, and (3) replicates across both body
75 size and temperature (factorially). We treat data as individual-level rates (per fish); however,
76 in some cases they were measured as averages across multiple individuals. In addition to these
77 general criteria, we also had criteria specific for each rate (see below). When several studies
78 were found for the same species, we did not include all but instead chose the study with the
79 largest body size and temperature range (in that order), as there can be large differences in
80 absolute values of some physiological parameters between studies.

81 For consumption and growth rate, we determined if each data point within species was
82 below or beyond peak temperature either by using information provided by the authors (e.g. by
83 deriving a polynomial regression of the rate as a function of temperature to find the temperature
84 of peak rate), by fitting quadratic models or visually inspecting data for each species separately.
85 Whether a data point was below or above peak or optimum temperatures is indicated by a
86 separate column in the data (Table S1).

87

88 ***Maximum consumption rate***

89 We used the following topic terms for maximum consumption rate (three searches in total):
90 (consumption OR bioenerg* OR ingestion OR “food-intake”) AND (mass OR weight OR size)
91 AND (temperature*), as well as: (feeding-rate OR bio-energ*) AND (mass OR weight OR
92 size) AND (temperature*) and lastly: (“food intake”) AND (mass OR weight OR size) AND
93 (temperature*). * represents any group of characters, including no character. The searches for
94 maximum consumption rate data resulted in 15259 articles (search date: 18 December 2018),
95 with 3449 remaining after filtering by subject categories. The second search (search date: 13
96 March 2019) resulted in 431 additional titles after filtering by subject categories (of which
97 some where duplicated from the first search) and the third search (search date: 29 June 2020)
98 yielded 626 but no additional articles as they had either been selected already or did not meet
99 the criteria. Articles were filtered out at the abstract and whole article stage if the original
100 reference could not be identified and evaluated, if data were normalized (i.e., using a priori
101 defined scaling relationships to show corrected data rather than measured values), there was no
102 acclimation, or if measurements were not maximum consumption rate. As with the growth
103 data, definitions of ad-libitum feeding may differ between studies – the key for our purpose is
104 that food rations led to satiation and were not limiting. Consumption rates were converted to

105 g day⁻¹ (but note we fitted models to mass-specific rates, g g⁻¹ day⁻¹). These data were
106 compiled in the file consumption_data.xlsx.

107

108 ***Metabolic rate***

109 We used the following topic terms for metabolic rate data: (metabolism OR "oxygen-
110 consumption" OR "oxygen consumption") AND (mass OR weight OR size) AND
111 (temperature*). * represents any group of characters, including no character. The search for
112 metabolic rate experiments resulted in 8405 articles (search date: 6 June 2019), which was
113 reduced to 3458 after applying filters for subject categories. Articles were filtered out at the
114 abstract and whole article stage if the original reference could not be identified and evaluated,
115 if data were normalized (i.e., using a priori defined scaling relationships to normalize data for
116 data a given size rather than measured values), if there was no acclimation or if it was not
117 standard, routine or resting metabolic rate. The latter was defined as oxygen consumption of
118 an unfed fish at no or little spontaneous activity. Metabolic rates were converted to mg O₂ h⁻¹,
119 because it was the most common unit in the data set (but note models were fitted to mass-
120 specific rates, mg O₂ g⁻¹ h⁻¹). These data were compiled in the file metabolism_data.xlsx.

121

122 ***Growth rates & optimum temperature for growth over body mass***

123 Growth rates were taken from data found in the literature search for optimum growth
124 temperatures. Therefore, articles in which growth rates were measured at sub-optimum
125 temperatures only were not included (note this is in contrast to consumption data where
126 "optimum" was not included in the search terms). We used the following topic terms for growth
127 rate data: (growth) AND (mass OR weight OR size) AND (temperature*) AND (optimum), as
128 well as: (growth) AND (mass OR weight OR size) AND (temperature*) AND (optim*). *
129 represents any group of characters, including no character. The two searches for growth rates

130 resulted in 3313 articles (search date: 22 March 2019), and 3747 articles (search date: 5 May
131 2019), respectively. After applying additional filters by subject category, we acquired 566 and
132 893 studies, respectively (of which some are duplicates due to similar search-strings). We
133 removed studies at the abstract and whole article stage where the original reference could not
134 be identified and evaluated, if we could not extract actual growth rates, if there was not a
135 controlled temperature for each growth trial, or if there were not multiple defined size-classes.
136 We used only one observation (data point) per size class and temperature treatment, and in
137 cases where there were two, we used the mean value. In addition, we ensured that no other
138 treatment (e.g., food limitation) confounded the response variable and thus only used data from
139 experiments with satiating food levels. Body mass is either the geometric mean of the initial
140 and final mass of the growth trial or the size class, depending on data availability (see Table
141 S1). It is important to control for feeding rations as it affects the temperature optimum for
142 growth². This was achieved in different ways in the different experimental studies, but
143 commonly involved excess feeding rations once or several times per day. The key description
144 we looked for in the study was that food was not limiting. We treat data as individual-level
145 growth (per fish); however, these were commonly measured as averages for multiple
146 individuals. In the case growth was length-based, we converted it to mass using weight-length
147 relationships from FishBase^{3,4}. We compiled two separate data sets: raw growth rates
148 (growth_data.xlsx) and temperature at optimum growth (growth_data_Topt.xlsx). In the latter,
149 we defined optimum temperature for growth as the fitted optimum temperature by size-class
150 (usually estimated in the original study). Therefore, the optimum temperature may not always
151 correspond to an actual experimental temperature but could be an estimation. If the optimum
152 temperature (by size group) was not estimated in the original study, we used the temperature
153 where growth rate was maximized. All growth rates were expressed in unit % day⁻¹.

154 **Table S1** Explanation of data columns (G=growth data, T_{opt}=optimum growth temperature

155 data, C=maximum consumption data, M=metabolism data).

Column	Explanation	Datasets
<i>growth_rate_%/day</i>	Main response variable.	G, T _{opt}
<i>opt_temp_c</i>	Main response variable.	T _{opt}
<i>initial_mass_g</i>	Body mass [g] at the onset of the growth trial.	G, T _{opt}
<i>final_mass_g</i>	Body mass [g] at the end of the growth trial.	G, T _{opt}
<i>geom_mean_mass_g</i>	Geometric mean mass in t ₁ and t ₂ of the growth trial.	G, T _{opt}
<i>size_group</i>	Representative body mass of size group in the growth trial, in case initial, final or geometric body mass could not be retrieved.	G, T _{opt}
<i>consumption</i>	Main response variable.	C
<i>metabolic_rate</i>	Main response variable.	M
<i>type</i>	Type of respiration measurement (resting, routine, standard).	M
<i>unit</i>	Unit of response variable.	C, M
<i>original_unit</i>	Original unit of response variable. If different from “ <i>unit</i> ”, see “ <i>notes</i> ” column for information on conversion.	C, M
<i>mass_g</i>	Body mass in experiment [g]. Some studies report body masses before and some after the feeding trials. See “ <i>notes</i> ”.	C, M
<i>temp_c</i>	Experimental temperature [°C].	G, C, M
<i>above_peak_temp</i>	Is the experiment conducted at temperature above peak temperature for the given size group? Y/N.	G, C, M
<i>common_name</i>	Common name of species.	G, T _{opt} , C, M
<i>species</i>	Scientific name of species.	G, T _{opt} , C, M
<i>genus</i>	Genus of species.	G, T _{opt} , C, M
<i>family</i>	Family of species.	G, T _{opt} , C, M
<i>order</i>	Order of species.	G, T _{opt} , C, M
<i>habitat</i>	Species natural habitat, taken from FishBase ⁴ .	G, T _{opt} , C, M
<i>lifestyle</i>	Lifestyle of species, taken from FishBase ⁴ .	G, T _{opt} , C, M
<i>biogeography</i>	Biogeography of species, taken from FishBase ⁴ .	G, T _{opt} , C, M
<i>trophic_level</i>	Trophic level of species, taken from FishBase ⁴ .	G, T _{opt} , C, M
<i>w_maturity_g</i>	Body mass [g] at maturation taken from FishBase	G, T _{opt}

	⁴ . If not available, weight was estimated from length using species-specific allometric weight-length, else taken from alternative sources (see "notes"). Used to estimate relative body size across species in the data and to normalized optimum growth temperatures across species.	
<i>w_max_published_g</i>	Max. published weight [g] taken from FishBase ⁴ . If not available, weight was estimated from length using species-specific allometric weight-length, else taken from alternative sources (see "notes"). Used to estimate relative body size across species in the data.	G, T _{opt} , C, M
<i>env_temp_min</i>	Min. environmental temperature [°C], taken from FishBase ⁴ . If not available on FishBase, data were taken from alternative sources (see "notes"). Used to compare experimental temperatures to common temperatures for species.	G, T _{opt} , C, M
<i>env_temp_max</i>	Max. environmental temperature [°C], taken from FishBase ⁴ . If not available on FishBase, data were taken from alternative sources (see "notes"). Used to compare experimental temperatures to common temperatures for species.	G, T _{opt} , C, M
<i>env_temp_mid</i>	Median of environmental temperature [°C], taken from FishBase ⁴ . If not available on FishBase, data were taken from alternative sources (see "notes"). Used to compare experimental temperatures to common temperatures for species.	G, T _{opt} , C, M
<i>pref_temp_mid</i>	Median of preferred temperature [°C], taken from FishBase ⁴ . If not available on FishBase, data were taken from alternative sources (see "notes"). Used to compare experimental temperatures to common temperatures for species.	G, T _{opt} , C, M
<i>notes</i>	This column contains additional information, including if data were sent by authors, if any column above has data that is not from the main source (i.e. FishBase), how certain metrics were calculated, alternative common names, comments on the experimental protocol, information on conversion to standard "unit", source of the data (literature search or cited in paper from literature search)	G, T _{opt} , C, M
<i>reference</i>	Source (See Table S2).	G, T _{opt} , C, M

156

157 **Table S2** Species, common name, the data set(s) in which they appear and the sources
 158 (G=growth data, T_{opt}=optimum growth temperature data, C=maximum consumption data,
 159 M=metabolism data). If more than one data and source, the sources are in order (1 study per

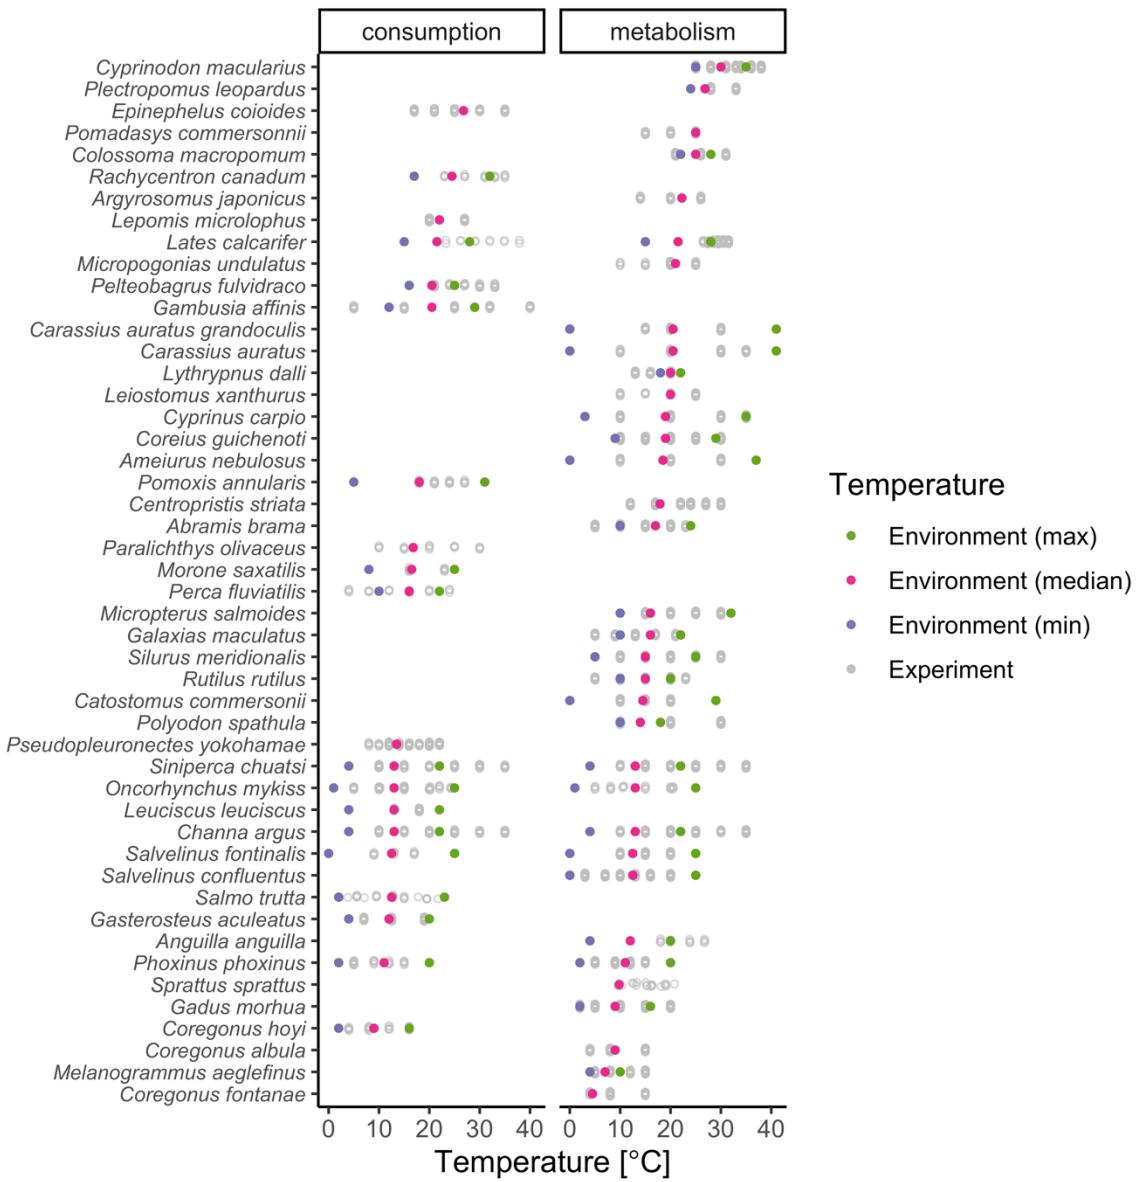

160 species and rate).

Species	Common name	Datasets	Source
<i>Pseudopleuronectes yokohamae</i>	Marbled flounder	G, T _{opt} , C	⁵
<i>Cyclopterus lumpus</i>	Lumpfish	G, T _{opt}	⁶
<i>Paralichthys olivaceus</i>	Japanese flounder (alt. bastard halibut, Japaneese halibut or Olive flounder)	G, T _{opt} , C	⁷
<i>Salvelinus alpinus</i>	Arctic char	G, T _{opt}	⁸
<i>Salmo salar</i>	Atlantic salmon	G, T _{opt}	⁹
<i>Lates calcarifer</i>	Barramundi	G, T _{opt} , C, M	¹⁰ ¹⁰ ¹⁰ ¹¹

 184 *vertically for visibility.*

185

186

187

188

189 **Supplementary methods and analysis**

190 At below peak temperatures, the intraspecific mass- and temperature dependence of specific
191 growth (% increase in size day⁻¹) can be described by the equation: $\ln(G) = 0.5 -$
192 $0.36 \times \ln(m) - 0.74 \times t_A + 0.0046 \times t_A \times \ln(m)$ (Fig. S12), based on posterior medians of
193 the global parameters, thus representing an average (unmeasured) fish. (see Fig S15, S19, S23
194 and S27 for the full posteriors distributions of parameters for all models). The mass exponent
195 of growth is estimated to be -0.36 [-0.5, -0.23] and the activation energy ($-\mu_{\beta_2}$) of growth 0.74
196 [0.95, 0.53]. This is similar to the predicted mass scaling of net energy at sub-optimum
197 temperatures, defined as the difference between consumption and metabolism (Fig. 3; see also
198 methods on '*Net energy gain*'), which scales with a mass-specific exponent of -0.38. The
199 estimated temperature-mass interaction coefficient is both small and uncertain (0.0046 [-0.064,
200 0.075]), where Bayesian 95% credible intervals are indicated in square brackets.

213 *Panel A) shows the natural log of specific growth rate as a function of body mass on a*
 214 *logarithmic x-axis (for readability, note the model is fitted with $\ln(\text{mass})$ as a predictor), such*
 215 *that the slope corresponds to the mass-scaling exponent. Colors indicate species. The line in*
 216 *panel A is the global prediction from model M1 at the mean temperature in the growth data*
 217 *(14°C, but note the model is fitted using Arrhenius temperature). Shaded areas correspond to*
 218 *80% and 95% credible intervals. Point colors indicate species. The bottom row shows the*
 219 *posterior distributions for (B) the global mass-scaling exponent, μ_{β_1} , (C) the global*
 220 *temperature coefficient, μ_{β_2} and (D) the global mass-temperature interaction, μ_{β_3} . Dashed*
 221 *white line shows the posterior median and red vertical line in (D) indicates zero.*

222 **Table S3** Description of model parameters (type and their interpretation in brackets) and their
 223 prior distributions (see ‘*Model description*’ and equations 1-3 in the main text). N refers to a
 224 normal distribution (mean and standard deviation, s.d.) and U to a uniform distribution
 225 (interval). For simplicity, only the parameters of the full model are shown here (i.e., with most
 226 coefficients varying by species), but note that when a model is fitted with a common rather
 227 than species-varying coefficient, for example β_1 instead of $\beta_{1j} \sim N(\mu_{\beta_1}, \sigma_{\beta_1})$, we use the same
 228 prior for β_1 as for μ_{β_1} .

Model	Parameter	Description	Prior distribution
Log-linear regressions for growth, consumption and metabolism	$\mu_{\beta_{0s}}$	Hyperparameter (average intercept for standard metabolic rate across species) <i>Only for metabolism model.</i>	$N(-2, 5)$
	$\mu_{\beta_{0r}}$	Hyperparameter (average intercept for routine and resting metabolic rate across species). <i>Only for metabolism model.</i>	$N(-1, 5)$
	μ_{β_0}	Hyperparameter (average intercept across species). <i>Only for consumption and growth models.</i>	$N(0, 5)$
	μ_{β_1}	Hyperparameter (average mass coefficient across species)	$N(-0.25, 1)$
	μ_{β_2}	Hyperparameter (average temperature coefficient across species)	$N(-0.6, 1)$
	μ_{β_3}	Hyperparameter (average interaction coefficient across species)	$N(0, 1)$
	$\sigma_{\beta_{0s}}$	Hyperparameter (s.d. of species-intercepts for standard metabolic rate)	$U(0, 10)$
	$\sigma_{\beta_{0r}}$	Hyperparameter (s.d. of species-intercepts for routine and resting metabolic rate)	$U(0, 10)$
	σ_{β_1}	Hyperparameter (s.d. of species mass coefficients)	$U(0, 10)$
	σ_{β_2}	Hyperparameter (s.d. of species temperature coefficients)	$U(0, 10)$
	σ_{β_3}	Hyperparameter (s.d. of species interaction coefficients)	$U(0, 10)$
	σ	Parameter (s.d.)	$U(0, 10)$
Sharpe-Schoolfield (unimodal consumption data)	$\mu_{c_{0j}}$	Hyperparameter (average consumption at reference temperature [-10 on centered scale] across species)	$N(1, 1)$
	μ_{E_j}	Hyperparameter (average activation energy across species)	$N(0.5, 0.5)$

	E_h	Parameter (common rate of decline with temperature)	$N(2, 2)$
	T_h	Parameter (common temperature at which half the rate is reduced due to high temperatures)	$N(5, 2)$
	σ_{E_j}	Hyperparameter (s.d. of species-varying activation energies)	$U(0, 3)$
	σ_{C_0j}	Hyperparameter (s.d. of species-varying average consumption)	$U(0, 3)$
	σ	Parameter (s.d.)	$U(0, 3)$
Linear T_{opt} models	μ_{β_0}	Hyperparameter (average intercept across species)	$N(0, 5)$
	μ_{β_1}	Hyperparameter (average mass coefficient across species)	$N(0, 5)$
	σ_{β_0}	Hyperparameter (s.d. of species-intercepts)	$U(0, 10)$
	σ_{β_1}	Hyperparameter (s.d. of species mass coefficients)	$U(0, 10)$
	σ	Parameter (s.d.)	$U(0, 10)$

245 **Table S4.** Model comparison for the log-linear regressions of how consumption, metabolism
 246 and growth depend on mass and temperature below optimum temperatures (see ‘*Model*
 247 *description*’ and equations 1-3 in the main text). The column m*t indicates whether the model
 248 for the rate includes an interactive effect of mass and temperature. The models differ in which
 249 coefficients vary among species and which are common, where β_0 is the intercept, β_1 mass
 250 coefficient (mass-exponent on linear scale), β_2 temperature coefficient (corresponding to the
 251 negative activation energy) and β_3 interaction between mass and temperature. The WAIC
 252 columns shows Δ WAIC and absolute WAIC in brackets, rounded to the nearest decimal, where
 253 Δ WAIC is the difference between each models’ WAIC and the lowest WAIC across models.
 254 Bold indicates models with Δ WAIC < 2.

Model	m*t	Species-varying parameter(s)	WAIC metabolism	WAIC consumption	WAIC growth
M1	Yes	$\beta_0, \beta_1, \beta_2, \beta_3$	0 (273.2)	4.3 (564.5)	0 (47.2)
M2		$\beta_0, \beta_1, \beta_2$	1.27 (274.5)	3.1 (563.4)	7.2 (54.4)
M3a		β_0, β_1	306.1 (579.3)	148.1 (708.4)	23.4 (70.6)
M3b		β_0, β_2	387.5 (660.7)	70.1 (630.4)	32.6 (79.8)
M4		β_0	649.6 (922.8)	189.9 (750.2)	43.5 (90.7)
M5	No	$\beta_0, \beta_1, \beta_2$	5.0 (278.2)	0 (560.2)	5.5 (52.7)
M6a		β_0, β_1	347.8 (621.0)	166.1 (726.3)	22.1 (69.3)
M6b		β_0, β_2	388.9 (662.1)	74.1 (634.4)	34.3 (81.5)
M7		β_0	682.2 (955.4)	213.9 (774.2)	44.9 (92.1)

260 **Table S5.** Comparison of the two models fitted to optimum growth temperature data. The
261 WAIC columns shows Δ WAIC and absolute WAIC in brackets, rounded to the nearest decimal,
262 where Δ WAIC is the difference between each models' WAIC and the lowest WAIC across
263 models. Bold indicates models with Δ WAIC < 2.

Model	Species-varying parameter(s)	WAIC
M1	β_0, β_1	0 (177.3)
M2	β_0	1 (178.3)

284 *Fig. S5. Posterior distributions of the global intraspecific mass-specific mass exponents (μ_{β_1})*
 285 *and temperature coefficients (μ_{β_2}) for metabolic rate (top) and maximum consumption rate*
 286 *(bottom). For metabolism, the global interaction coefficient (μ_{β_3}) is also shown (estimated and*
 287 *presented on an Arrhenius temperature scale), but for consumption this term was not included*
 288 *in the selected model. Numbers in the top left corner correspond to the posterior median. The*
 289 *axes are the same for each parameter for comparison between the two rates.*

290

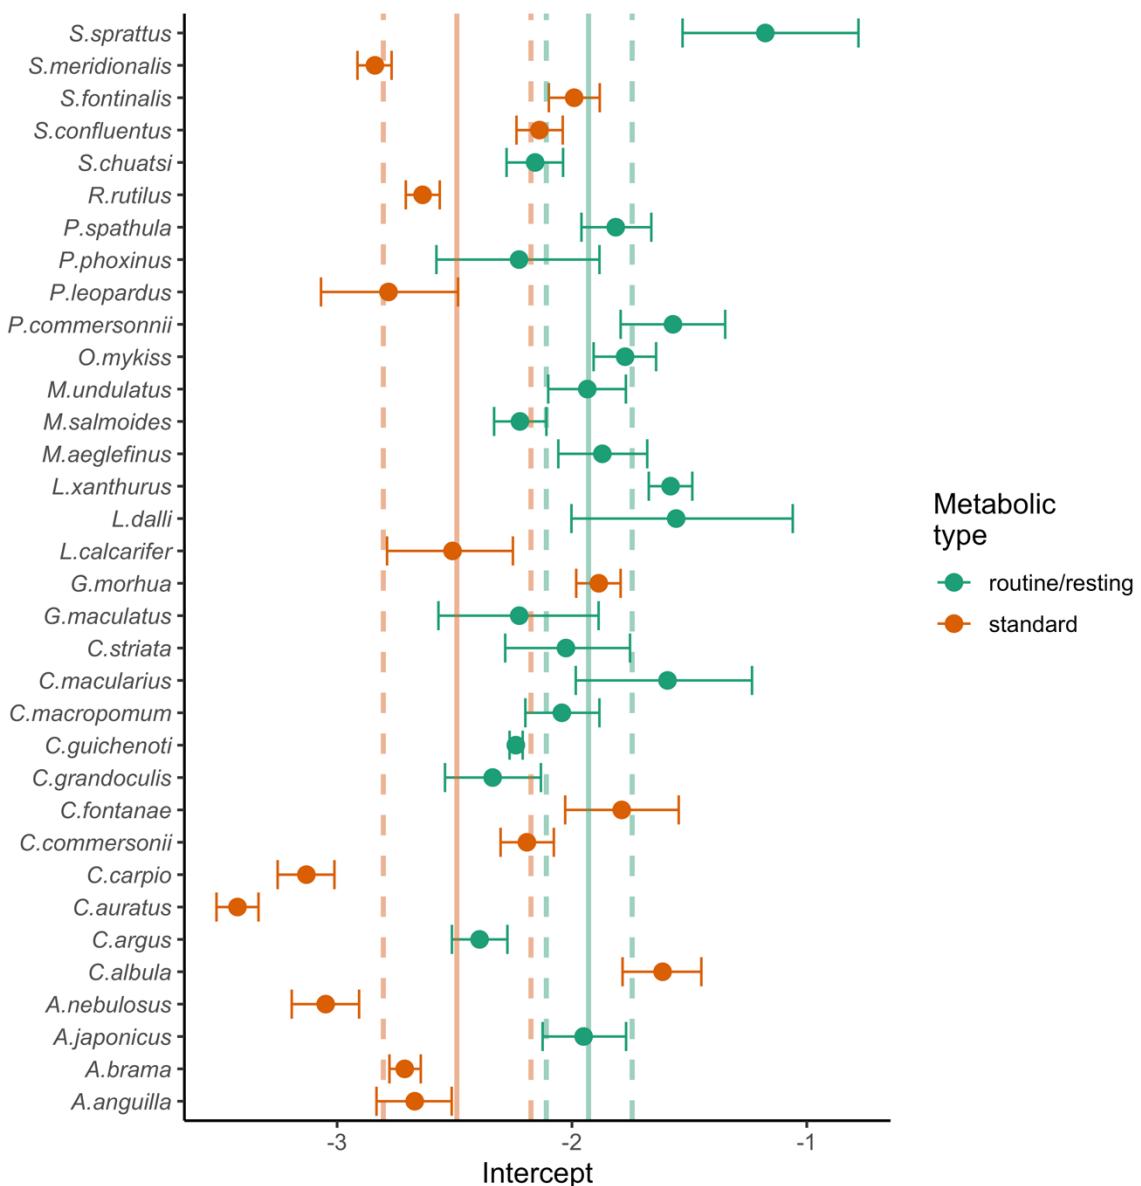

291

292

293 *Fig. S6. Experimental temperatures (grey) overlap environmental temperatures (green), and*
 294 *optimum growth temperatures (orange) are typically at the upper end or above the*
 295 *environmental range. Horizontal green lines show the minimum and maximum environmental*
 296 *temperature based on either temperature in distribution range (triangles) or modelled*
 297 *distribution maps (circles), both taken from FishBase. The optimum growth temperatures are*
 298 *depicted for all size-classes per species, where the circle size is proportional to number of*
 299 *observations at that temperature.*

300

301

302 *Fig. S7. Posterior median of species-level intercepts (points) and their 95% credible interval*
 303 *(horizontal error bars). Colors indicate the type of metabolism measurement for each species.*
 304 *Vertical solid lines are the posterior medians of the global intercepts (orange for standard*
 305 *metabolic rate, μ_{β_0s} , and green for routine or resting metabolic rate, μ_{β_0r}), and the dashed*
 306 *vertical lines show the 95% credible intervals for the global parameters.*

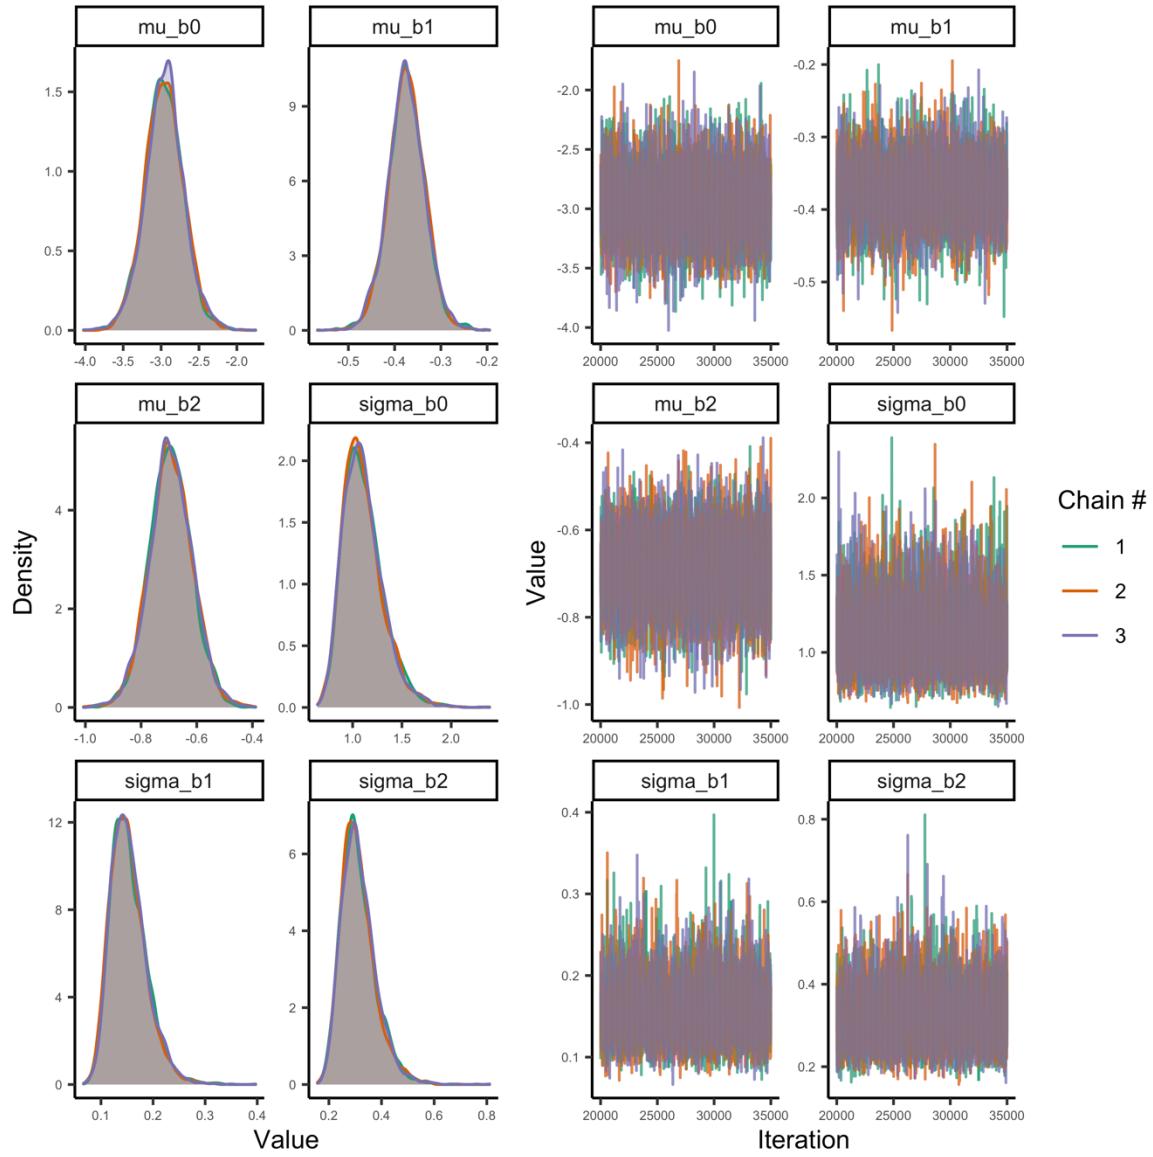

307

308 **Model validation and fit**

309 Figures showing convergence of species-level parameters can be found on:

310 <https://github.com/maxlindmark/scaling>, in this section only global parameters are visualized.

311 **Maximum consumption rate – below peak temperatures**
